

ABSTRACT OF THE DISCLOSURE

The present invention of easy construction provides a simple and economical alternative to many complex walking problems. The therapeutic wood layer and the rubber safety layer are combined and attached to many styles of specified purchased shoes. Almost immediately, the individual is encouraged with a noticeable significant skeletal realignment. This gentle traction pull is pain free. Since all therapeutic soles are custom made, any individual can benefit. Plus, these customized soles are an excellent alternative for those who can not wear orthotic devices. For individuals with multiple walking problems, using a wheeled walker to establish balance, posture and a walking pattern is suggested.

This form of preventative medicine will not only stop the progressive degenerative walking patterns but reverse them.
